Similarly, you can break up a single power of 2 into two powers which add up to the original power, such as $2^9 (512) = 2^6 + 3 = 2^6 (64) \times 2^3 (8)$. TECHNIQUE: We'll start with 2^{15} as an example. Start by breaking up the given power of 2 into the largest multiple of 10 which is equal to or less than the given power, and multiply it by ...

Grey Matters: Blog: Calculate Powers of 2 In Your Head!

A power of two is a number of the form 2^n where n is an integer, that is, the result of exponentiation with number two as the base and integer n as the exponent.. In a context where only integers are considered, n is restricted to non-negative values, so we have 1, 2, and 2 multiplied by itself a certain number of times. Because two is the base of the binary numeral system, powers of two are ...

Power of Numbers Calculator - Easycalculation.com

It is important to recall some basic information about the powers of the numbers. To begin with, a power shows how many times a number is multiplied by itself. For example, if we take a number 2 raised to the power of 2, or squared, (written like this - 2^2) then we get an answer of 4. This is because $2 \times 2 = 4$. So we have multiplied 2 by itself twice.
